

Genetically modified food

Genetically modified food is great for us because it has better food at a lower price. for example have you ever gone to a store and seen the organic food costing more than genetically modified food and the reason for that is because genetically modified food is made at a more affordable price. According to a article by UC Santa Cruz says that “genetic engineering of plant has the potential to provide edible plant that could be used to immunize individuals against a wide variety of infectious diseases ranging from cholera to potential AIDS” this shows that genetically modified food is great for us.
